

ABSTRACT OF THE DISCLOSURE

There is provided an image processing apparatus including an image processing unit for performing image processing on an input image to produce an output image; a storing unit for storing image-related information relating to at least one image processed by the image processing unit; a search unit for searching the storing unit in response to an instruction for reprocessing the input image and reading the image-related information previously stored in the storing unit; and a display unit for representing a result of a search performed by the search unit. The image processing unit performs reprocessing of the input image in accordance with the image-related information that the search unit read in response to the instruction for reprocessing the input image. A reprint, on which an image whose color and density are preferably in agreement with those of the image reproduced on a simultaneous print is reproduced, can be stably output with a simple manipulation.
